

Emotional Health

Approximately one third (31%) of the total student population affirmed having depressive symptoms. This is identical to the 2003 survey results. There was a slight increase among students with a GPA <2.9 (37%) as compared with those with a 3.0 > GPA (27%).

The following charts correlate report of depression with a variety of adolescent behaviors.

It is notable that 37% of student who reported having had an episode of depression also reported having used alcohol 50+ times in their lifetime. While only 17% of students who reported an episode of depression had never used alcohol. Of those who denied an episode of depression, 40% had never used alcohol.

Those who have never used marijuana are nearly twice as likely to report not experiencing depression as opposed to those who report depression.

Students who do not report depression predictably sleep better than those who do report depression.
